Chapter I

INTRODUCTION

Career selection can be challenging for every student, requiring careful preparation and decision-making. Deciding the right career path is akin to ordering a meal at a restaurant, where one must choose from various options, requiring careful consideration and evaluation of the available alternatives. Thus, students are frequently overwhelmed about which path to take in today's ever-changing employment market. Sharif, Ahmad, and Sarwar (2019) found that many students struggle to choose a career path, believing it to be a significant factor in deciding their future.

According to Saleem, Hanan, Saleem, and Shamshad (2014) career selection in the modern era has become convoluted due to an individual's dependence on mass media. According to their study titled "Career Selection: Role of Parent's Profession, Mass Media and Personal Choice," the findings are consistent with the cultural norms in Pakistan, where parents traditionally influence their children's career choices. However, with the rapid expansion of mass media, there is a potential to play a more prominent role in providing awareness, education, and career development programs to offer a reliable and dynamic source of guidance. Thus, mass media has a growing impact on career choices, both directly through mature observation and indirectly through the influence of parental professions on personal preferences over time.

Furthermore, students were more likely to recognize sources of inspiration and models of professional success in media programs they consumed rather than in their everyday lives. According to a study by Lester in 2022, civil engineering students' decision-making is influenced by various factors. The study found that motivation, including conflicting interests and traditional reward structures, played a significant role in their decision-making process. Additionally, intrinsic motivation, particularly relatedness with peers and instructors, was found to be necessary.

Streaming services and social media have become integral to our lives, including in the Philippines. While they offer multiple benefits, it is essential to be aware of some of the potential negative impacts they can have. Streaming services may only sometimes be considered a good influence because they can contribute to a loss of monoculture and the societal bonds that come with watching a piece of media as a group (Escobar, 2020). With access to countless series and movies, people may spend more time watching content alone, which can decrease social interactions and shared experiences.

This study aims to add further information related to prior study conducted by Banaga, Boltron, Diputado, Maquidato, Mondega, Ranes, Recla, and Renadaje (2022), which aims to examine the factors that influences and pushes the grade 12 STEM students of NDDU in pursuing medical courses. Situated within the academic setting of Notre Dame of Dadiangas University, which is known for its dedication to deliver high-quality education and developing competent professionals, this study aims to provide intricate insights into the complex relationship between modern media consumption and career decision-making.

According to the study of Rendaje et al. (2022), STEM students who choose to pursue a medical course are also influenced by their extrinsic motivations: huge financial incentives, high salaries, the desire to gain recognition in the field, and the popularity of the job. These following factors might be either from the media or other sources of information (i.e., family influence, peer influence, etc.). It can also be classified as information sharing and perception because it highlights how various pieces of information can give insights into the students' career choices and shape their perceptions of the job. This study can help fill in the gap if the information shared about the career or the perception of the career from social media and streaming services has an influence on their career paths.

NDDU promotes various core values, and two values can be aligned with the researchers' study: quality education and competent professionals. Quality education and competent professionals might influence the career choices of first-year college students at NDDU, particularly in the realm of streaming services and social media. Quality education equips students to critically analyze the information they encounter on these platforms, aiding them in making informed career decisions. Competent professionals, as role models, share insights and experiences on social media, potentially inspiring students to pursue similar paths. Ultimately, a blend of quality education and professional guidance might impact the career aspirations of the students at NDDU.

As Hontiveros (2021) stated, social media emerged as an alternative landscape connecting individual and occupational success. For students, especially in their first year of college, the school must clarify that not all that can

be seen on social media will fill up their system with a good education and enhance their competitiveness. Streaming services also provide a fantasy expectation in terms of the real-world situation, wherein individuals foresee it, and later on, disappointment can be seen on their faces after finding out what it is in actuality. NDDU can utilize this study to aid students in choosing the right path to reach their destination. The school can help students by gathering data on why they think that the course they took, especially at first-year colleges, will give them a quality education aligned with their capacity and desire and enhance their competitiveness in terms of professionalism for the future.

Lipscomb (2022) highlights that people's views of certain professions are influenced by the career recommendations portrayed in movies and television shows. Although new media can broaden the individual's horizons, it also questions the authenticity of one's choices. Selecting a career path involves the interplay of many intricately intertwined factors. It is a complex task involving a difficult decision-making process (Kazi & Akhlaq, 2017). Thus, a single wrong choice can alter the students' fate. Furthermore, Cooper (2013) found a need for more studies regarding the influence of media on college students' career choices. Thus, the researchers were intrigued to determine how streaming services and social media impact the opinions of first-year college students at NDDU regarding different career choices. This study aims to provide information to students who may need help choosing them and improve their understanding of how streaming services and social media exposure may influence an individual's career choice.

This study's results will significantly affect teachers, parents, and students. Programs that may help the students evaluate their future career paths more carefully, reduce distractions from media, and improve their focus on academic performance may develop. This information will help institutions and parents develop specific intervention methods to aid their children in their career choices. Additionally, students may utilize this study to assess their judgment, focus on improving themselves, and make much more logical decisions.

Literature Review

The researchers found that the following factors are most prevalent in shaping opinions on choosing a career path: information sharing, as social media allows the dissemination of information at rapid rates, it is undeniable that it may have an influence on career choices; role models, as students tend to follow the actions, decisions, and opinions of their peers and figures that they idolize, which can influence their career decisions; perception, as careers are portrayed in media in a manner that appeals to the viewers, which may influence the students career choices as these portrayals may not accurately reflect the reality of the industry. Here is an in-depth explanation of the key factors to consider when choosing a career path:

Information Sharing

Peer influence through social media can significantly impact students' behavior and opinion formation, leading to peer pressure and adverse outcomes. In a study by Ellison and Fudenberg (1995), as cited by Yelishala (2022), users' decisions are significantly influenced by the decisions of their peers, even when the options are identical. Marketing firms widely use this phenomenon of peer influence as an advertising strategy on social media platforms. Consequently, social media influencers play a significant role in shaping consumers' decisions. However, the abundance of information available at our fingertips can make it challenging to distinguish credible and relevant information from the rest (Kapoor, Tamilmani, Rana, Patil, Dwivedi, & Nerur, 2017).

In addition, the interplay between streaming and social media creates a complex network of influences on individual decision-making (Lipscomb, 2022). Thus, it is essential to comprehend these influences in the digital age, where recommendations can be easily mistaken for manipulation. Career choice preferences are based on parents' and relatives' advice and directives. Using the Internet to aid in career decisions is not new. Making Better Career Decisions (MBCD) was previously established on the internet. Assist people in making professional decisions. This demonstrates that the internet has a high potential for usage as a tool. Interaction medium for career planners to assist people in making choices and career decisions critical to survival. Students' proclivity to utilize the internet as a resource. The use of media for self-learning is very high, reaching 69.2%, which validates the findings of this study. According to Edris Zamroni, Nur

Mahardika, Susilo Rahardjo, and Masturi (2022), 61% of students utilize social media to research their vocations.

According to Kettunen (2017), social media delivers and disseminates information quickly, allowing career practitioners to reach many people instantaneously. However, using social media as an information source for professional purposes, including school education, concerns some. Practitioners emphasize that active and safe participation on social media requires honed skills and the ability to seek, choose, and evaluate complex online content. In career education, this means a stronger emphasis on guiding young people on how to use the information and how to evaluate the reliability and validity of career information and the various sources in the light of lifelong career management skills.

Role Models

Mcleod (2023) explains that children learn from different models, including their family, friends, media, and school. Bandura's Social Learning Theory (1977), as cited by Online MSW Programs (2022), supports this idea, as children tend to follow the behaviors of those around them, including family members, friends, public figures, and even characters from television shows. Social media platforms provide numerous examples of social learning, where people imitate each other by recreating movie scenes, copying dance moves from music videos, and participating in various challenges.

Terry and Peck (2019) emphasize that fictional medical shows can impact career choices beyond entertainment. In their study titled "Television as a Career Motivator and Education Tool: A Final-Year Nursing Student Cohort Study," out of 291 students who participated, with an 82.6% response rate, motivations for entering nursing were similar to other international studies. However, fictional medical television programs were rated higher as motivators than job security. The study discovered that students engage with medical television programs along a television-learning continuum, ranging from limited watching time, recognizing inaccuracies, and understanding dialogue to using fictional medical Television shows as tools for learning.

Shows highlighting different professions can affect students' career choices. For instance, medical television shows like "Grey's Anatomy" and "The Good Doctor" inspire students interested in medicine. Similarly, other shows that depict different professions could encourage students to pursue those career paths (Lubenov, 2021). Additionally, according to Adedeji, Ojelabi, Lekan, and Adefarati (2017), as cited by Njogu, Kibaara, Eldik, Kneer, Lutkenhaus, and Jansz (2019), famous people on television, radio, and print media can influence high school student's career choice and self-identity.

Furthermore, students often look up to individuals on social platforms as role models whose actions, achievements, and career paths they seek to emulate. These role models shape the perception of career paths and contribute to the career decision-making process among students in higher education (Oguguo, Ajuonuma, Azubuike, Ene, Atta, & Oko, 2020). Social media amplifies the

accessibility and influence of these role models, making them powerful sources of inspiration and guidance for students in shaping their career trajectories (El-badawy & Hashem, 2014).

According to Nelson, 2001, as cited by Stephanie (2011) study, family and school environment significantly influence students' course choices", with sex playing a significant role in this. Stereotyping, particularly in STEM fields, often leads to male students being expected to succeed in different fields. This is exacerbated by male-dominated classroom culture, feminine appearance, peer pressure, and family responsibilities. Teachers also treat gifted students differently, lowering female students' expectations.

Furthermore, in the medical sector, role models, competent individuals who inspire juniors, play a crucial role in shaping career decisions. A systematic review of female surgeons' career decisions has examined their influence, but local studies are limited. A Japanese study found that female surgeons value having a role model, but finding the right one is challenging. Social media and streaming services also contribute to this issue, with individuals like students being more excited about the content they see on these platforms due to its persuasion (Harun, Almustafa, AlKhalifah, Nammazi, AlBaqami, ALSaleh, Kadi, Farsi & Malibary, 2022).

Modern life is dominated by media and communication technologies, all of which affect how people perceive the world and interact with other people in society. (Hoag, Carpenter & Grant, 2017). With the emergence of social media and

streaming services, individuals, including students, now have an easier way of accessing opinions from their role models. These role models inspire those who look up to them; their influence may serve as guidance and direction for students who aspire to be like their role models to match or surpass their achievements and accomplishments.

Perception

Streaming services have changed the entertainment industry, offering new ways to be creative. Social media can influence behavior and attitudes, but too much use can set unrealistic standards. It can also connect people and give a voice to minorities. Some trends may harm health and discourage individuality. In an article by Thomas (2016), Dr. Jazayeri, an associate professor of clinical psychology, states that the virtual world can divert people from their real lives to the point where they either forget who they are or become so immersed in the reality they have created that they do not want to address their problems.

In another study, it is mentioned that the few studies on primary selection generally fall into three categories, which are the relationship between personality-environment and significant selection, the connection between demographics such as race and gender, and students' perceptions and beliefs about a specific major; and the impact of salient referents on students' decisions such as parents, friends, high school teachers, college professors, and academic counselors (Hoag et al., 2017).

In an article by Rafei in 2016, she professed that many published career-related films often pivot towards careers associated with the police force, healthcare, and law. These careers are fundamental fragments of society, and students who aspire to pursue them are often influenced by shows or media that portray the handiwork of professionals. However, the career-related activities may only partially encapsulate the true nature of the career. The diversity of the demographics in such films is often emphasized in movies. In contrast, demographics in the workplace are often alike with insignificant differences, as movies make an effort at diversity.

This peculiarity insinuates that career-related movies should not be viewed as a source of information, as they may exaggerate and dramatize the career to appeal to viewers. Career-related movies enable their audience to produce a depiction or portrayal of a career based on things such as the illustrated daily duties, events, and dramas that may occur within the career. However, these films need to provide complete information on the procedure or the requirements needed to become a career professional. Thus, determining the genuine information regarding a career should be given importance, as streaming services and social media introduce us to different careers that may evoke interest in students.

Conceptual Framework

The conceptual framework of the study consists of three dependent variables. The independent variables would be 'Streaming Services' and 'Social Media.' The variables determine the level of influence of streaming services and social media exposure on the career choices of first-year college students. On the other hand, the dependent variable is the influence of streaming services and social media exposure on career choices in Information Sharing, Role Models, and Perception. These factors greatly help the study as it aims to determine the influence of Streaming Services and Social Media exposure on Career Choices. These variables aim to know the extent of streaming services and social media exposure influence among first-year college students enrolled at NDDU - Main Campus.

Figure 1. Conceptual Framework

Statement of the Problem

This study aims to determine the impact of streaming services and social media exposure on choosing career paths among college students at NDDU in the school year 2023-2024.

Specifically, it seeks to answer the underlying questions:

1. What is the demographic profile of the respondents in terms of:
 - 1.1 Sex; and
 - 1.2 Course?
2. What is the level of influence of Social Media Exposure on the career choices of the respondents, in terms of:
 - 2.1 Information Sharing;
 - 2.2 Role Models; and
 - 2.3 Perception?
3. What is the level of influence of Streaming Services Exposure on the career choices of the respondents, in terms of:
 - 3.1 Information Sharing;
 - 3.2 Role Models; and
 - 3.3 Perception?
4. Is there a significant difference between the level of influence of Social Media and Streaming Services Exposure and the career choices of the respondents across their sexes and courses?

Hypothesis

H₀: There is no significant difference between the level of influence of streaming services and social media exposure on the career choices of college students

H_a: There is a significant difference between the level of influence of streaming services and social media exposure on the career choices of college students

Scope and Delimitation

The purpose of the study is to evaluate the influence of streaming services and social media exposure on first-year college students at NDDU - Main Campus for the academic year 2023-2024 in terms of Information Sharing, Role Models, and Perception. The study will employ a pre-approved survey questionnaire to collect data from respondents. The total number of respondents is two hundred ninety-seven (297), divided by their courses or strata. The distribution, achieved using ratio and proportion, is as follows: seventy-five (75) from the College of Engineering, Architecture, and Technology, thirty-four (34) from the College of Arts and Sciences, nineteen (19) from the College of Education, one hundred one (101) from the College of Health Sciences, and sixty-eight (68) from the Business College. The sample size was determined using Slovin's formula, considering a five percent (5%) margin of error and a total of one thousand one hundred forty-seven (1147) first-year students across all four departments (College of Engineering, Architecture, and Technology, Health Science, Arts and Sciences, Education, and Business College). The survey will be conducted through Google Forms.

The study focuses on first-year college students due to the stability of their academic choices, as they have made significant decisions about their academic direction, unlike senior high school students or other college year levels who may still be exploring or shifting majors. Due to the irregularity of the schedule of first-year college students and time constraints, conducting the survey through face-to-face interactions is not possible with the goal of reaching the target number of respondents.

Significance of the Study

This study aims to gather valuable information on the difference between streaming services and social media exposure and their influence on the career choices of first-year college students at NDDU. It may provide enlightening knowledge on how their career choices may have been influenced by such factors and help them re-evaluate when choosing a career path. The results of this study will help shed light on the extent to which streaming services and social media exposure influence the career choices of NDDU's first-year college students. This study will provide a significant contribution to the following:

The School. By understanding the impact of digital media on students' career choices, the school can tailor its guidance and counseling programs to better assist students in their career planning. Furthermore, this study can help the school in strategic planning, particularly in integrating digital media literacy and awareness into the curriculum.

The Teachers. This study may help teachers gain new perspectives as guidance to convey and bring forward new topics with favorable outcomes and assess the teacher's teaching methods. Additionally, it can lead to tailored curricula, critical thinking, and media literacy among students.

Academic Counselors. To better understand the factors influencing students' career choices and provide more practical guidance and support. Additionally, the results of this study can serve as a basis for information when developing programs or projects that aim to assist students who are having difficulties choosing a career path.

Mental Health Professionals. Mental health professionals can utilize the findings to gain insight into the possible psychological consequences of exposure to social media and streaming services. This knowledge can aid them in creating effective techniques to assist students in handling the adverse effects and promoting healthy usage of these platforms.

Parents. Understanding the impact of streaming services and social media on their children's career choices can help parents guide their children to make informed decisions. They can also use this information to monitor and manage their children's exposure to these platforms. Furthermore, the results of this study may provide parents with insights into the different ways the cultivation of children has changed over time, giving them much-needed information for better family planning.

The Students. Influence that students' may obtain from this study regarding their perspectives on career selection and how streaming services and social media can impact their choices. This could result in a challenging environment where their abilities must align with the requirements, leading to lower morale. Additionally, the study can guide students, allowing them to make informed decisions about their chosen career path and inspiring them to pursue their goals passionately. It can help students become more aware of their interests, motivations, and objectives, explore various career options, and make informed decisions based on reliable sources of information.

Future Researchers. Other researchers can use this study and may serve as a basis on which they can utilize the product of the study to compare and contrast with their results. Studies focusing on similar topics, such as how social media and streaming services influence students' outlook on different careers, may also benefit, as they can extract information such as the research framework. It can help future researchers contribute to the existing literature on the relationship between streaming services, social media, and career paths. It can also help them identify gaps and limitations in the current research and propose new questions and hypotheses for further investigation.

Chapter II

METHODS

The chapter illustrates the methods, strategies, and procedures used for collecting data, the research design, and the techniques used to determine the selection of respondents. This study uses different techniques to assess the influence of streaming services and social media exposure on the career choices of first-year college students at NDDU.

Research Design

The researchers will utilize a Descriptive Correlational study using a quantitative approach to gather information about the present condition. TipsFolder (n.d.) defines that descriptive correlational studies describe the variables and the natural connections that occur between and among them. It is utilized to determine the extent to which a relationship exists between two or more variables. Descriptive research is a type of study that provides a snapshot of the present situation. Correlational research is a type of research that strives to discover relationships between variables and predict future events based on current knowledge. The researchers will utilize a survey questionnaire to measure our variables of interest.

Selection of Respondents

The respondents of the study are First-Year College students and identified using Slovin's Formula $n = \frac{N}{1 + Ne^2}$ with a 5% margin of error. Stratified random sampling will be used to divide the respondents by their courses, and the quantity of respondents per course will be based on the ratio and proportion of the number of first-year college students per course to the total population. Lastly, the researchers will be randomly picking respondents within their courses or strata to answer the online survey questionnaire.

$$n = \frac{1147}{1 + (1147(5\%)^2)}$$

$$n = 296.574014221 \approx 297$$

Where,

n = sample size

N = total population

1 = constant

e = 5%/0.05

Courses	Population of first-year college	Percent (%)	Sample Size
College of Engineering, Architecture and Technology (CEAT)	291	25.37%	75
College of Arts and Science (CAS)	131	11.42%	34

College of Education (COED)	72	6.28%	19
College of Health Science (CHS)	391	34.09%	101
Business College (BC)	262	22.84%	68
	1147	100%	297

Table 1. The distribution of respondents

Research Instruments

The instrument used for this study will be a Researcher-Made Questionnaire for data gathering. The questionnaire in Likert-scale form derived from the Review of Related Literature will be pre-approved and will undergo validation. The questionnaire will be used to gather data on the degree of influence of streaming services and social media on first-year college students, their difference, and their career paths. After finalizing these, we will find the approval of Notre Dame of Dadiangas University's proper authorities to allow the researchers to conduct this study. The instrument will be rated using a four-point response scale below.

Rating	Description	Verbal Interpretation
4	Strongly Agree	The student is in favor of the statement with a frequency level of 76% - 100%.
3	Agree	The student is in favor of

		the statement with a frequency level of 51% - 76%.
2	Disagree	The student is in favor of the statement with a frequency level of 26% - 50%.
1	Strongly Disagree	The student is in favor of the statement with a frequency level of 1% - 25%.

Table 2. Point Likert Scale

Data Gathering Procedure

Beforehand, the researchers wrote letters of approval addressed to the offices of the Deans of Engineering, Architecture, and Technology, Business, Arts and Sciences, Health Sciences, and Education to conduct the study. After that, the researchers will have the grammar of their questionnaire checked and corrected by their chosen grammarian, whose expertise is in English or Research subjects.

To represent the agreement of the selected respondents to provide information, participate in the study, and clarify the benefits and possible risks that may occur when participating in this research, they are asked to sign the Informed Consent Form. During data gathering, face-to-face methods will be utilized in conducting the surveys among first-year college students. Two hundred ninety-seven (297) respondents were stratified into their courses and randomly selected, and they will be asked to fill out the printed survey questionnaire.

A 4-point likert scale would be utilized to measure different data that researchers may gather from the students response. Each answer may correspond to a specific answer; Strongly Agree, Agree, Disagree, and Strongly Disagree. Before administering the questionnaire, researchers will undergo pilot testing to recognize issues prior to the survey's implementation.

Data Analysis

To determine the distribution of respondents, the researchers utilized Percentage to have a fixed allocation of respondents per course. The following are the different statistical treatments that will be employed: Z-test, One-Way ANOVA, Frequency Count, Mean, Pearson Correlation Coefficient (r), and Multiple Regression analysis. The Z-test will be used if there is a difference between the two sexes. One-way ANOVA will be used to see if there is a difference between the strands. The frequency count will be used to count how many respondents fall into each category. The mean will be used for the second statement of the problem and the questionnaire, the Pearson Correlation Coefficient (r) will be used for the fourth statement of the problem, and multiple regression analysis will be used to find if there is a relationship between the dependent variables and independent variables. This will help determine the level of influence of streaming services and social media exposure on the career choices of first-year college students at NDDU. The analysis will focus on five key factors: Information Sharing, Role Models, and Perception. The statement of the problem will undergo verification and approval by a statistician.

Box 1. Likert Scale for Level of Influence of Streaming Services and Social Media Exposure on Career Choices.

Mean Range	Description
3.26 - 4.00	Strongly Agree
2.51 - 3.25	Agree
1.76 - 2.50	Disagree
1.00 - 1.75	Strongly Disagree

All tests will be done at the 0.05 level of significance.

Ethical Considerations

The researchers of this study devote themselves to maintaining the confidentiality of every respondent. The gathered information from the respondents will be treated with the utmost confidentiality. All data will be securely stored following Republic Act 10173, the "Data Privacy Act of 2012," and moral standards. The gathered data will serve no purpose besides this study; it will only be used for that. Respondents will remain anonymous during the study; personal information will be protected. The researchers ensure that the respondents will not be subjected to tests that may lead to physical or mental trauma. As the researchers gain permission to utilize the gathered data, the consent provided by the respondents will be held with the utmost honesty and compliance. The study will be conducted face-to-face through a survey, and the researchers promise that the respondents will not be negatively affected by the threats of illnesses, following the implemented regulations regarding health and wellness.

Survey Questionnaire

PART 1. Demographics

Name (Optional):

Course:

- ☐ College of Engineering, Architecture, and Technology
- ☐ College of Health Science
- ☐ Business College
- ☐ College of Education
- ☐ College Arts and Science

PART 2. Level of Influence of Social Media and Streaming Services

Directions: The questionnaire determines the prevalent factor that influenced the student's career choice. Please read each statement carefully and check (✓) your level of agreement or disagreement using the 4-point Likert scale provided below.

Streaming Services

Information Sharing	4 Strongly Agree	3 Agree	2 Disagree	1 Strongly Disagree
1. The information I got from streaming services and social media platforms or my peers, encouraged me to choose a specific career.				
2. The content I watch on streaming services modifies my insights regarding various professions and career paths.				
3. Streaming platforms have influenced my career				

interests and made me consider career paths I had not thought about before.				
4. Streaming services provide valuable information about educational and professional development opportunities which can influence career decisions.				
5. The ease of accessing information through streaming has made it more influential to choose a specific career path due to the overwhelming number of options available.				
6. Sharing personal challenges, setbacks, and perseverance stories on streaming services inspires me to overcome challenges and pursue my desired career.				
7. Expressing achievements and progress on social media influences my career choice, as the feedback and approval from my peers boosts my confidence to pursue the career.				
8. My choices are influenced by the usage of social media and streaming services as outlets through which I can express my passions.				
9. My choices are influenced by the total amount of development and advancements that occurred in the industry disclosed in social media.				
Role Models	4 Strongly Agree	3 Agree	2 Disagree	1 Strongly Disagree
1. I chose this program because I was influenced by the person I followed on Social Media (e.g. Facebook, Twitter, TikTok, Instagram).				
2. Honesty and transparency of influencers on social media influence my perception of success and my career choice.				
3. The characteristics I esteem of the actor have influenced my career aspirations.				
4. Social media influencers or celebrities play a significant role in shaping my career choices and aspirations.				

5. Peers within my social media inspired me when it came to the career path I had chosen.				
6. Influential characters from movies and television shows influenced my decision in pursuing a specific career.				
7. Actors who challenge stereotypes and break barriers in their roles inspire me to pursue unfamiliar or unusual career paths.				
8. Actor's actions or accomplishments in a specific movie/series have influenced my career decisions.				
9. Professional characters portrayed by actors on movies/series impact my perception in different professions				
10. I chose this program because I am a fan of an influential character and I wanted to be like them				
11. I chose this program because I am influenced by my parents' career.				
12. I am influenced by the cultural icons in movies/films who inspired me to pursue this program.				
13. A person who started at the bottom and became one of the most successful human beings influenced me to strive hard and to follow/surpass them.				
14. I chose this program because of the exposure to the field/profession induced by social media influencers.				
15. I chose this program by actively asking for the advice of social media figures that I look up to.				
16. I chose this program because of the moral and ethical standards declared by social media icons that I admire.				
17. I chose this course because I grew up looking up to those people who succeed in this program.				

18. The representation of historical figures in streaming services associated with my chosen course has influenced my career choice.				
19. The beneficence of the professionals that align with my course opens my vision to contribute further effort for society.				
20. I chose this program because I was intrigued by the workplace culture and practices of the profession disclosed by social media influencers I follow.				
Perception	4 Strongly Agree	3 Agree	2 Disagree	1 Strongly Disagree
1. My choices and decisions are often constructed around the opinions and trends present on social media.				
2. My choice in choosing this program was influenced by the information circulating around social media.				
3. My expectations regarding my chosen career path are often reinforced when I watch media content that aligns with my interests.				
4. My reason for choosing this program is that various individuals specify that it contains a high amount of salary.				
5. My opinion and outlook on careers were influenced by concerns and issues within the industry, such as workplace culture and ethical concerns presented in social media and streaming services.				
6. My outlook on my career path was influenced by the total amount of development in the industry disclosed in streaming services and social media platforms.				
7. The reliable data of many individuals who succeeded in the program influenced my choice in choosing this course.				
8. My belief in choosing this program was influenced by the influencers online saying that I could ace this program.				
9. My choices and decisions were constructed by my				

parents/relatives because of the social media/streaming services that influenced them.				
10. My reason for choosing this course was because of the influence of social media that when you did not pass a specific course, you can apply to this program for an easy process.				

Social Media

Information Sharing	4 Strongly Agree	3 Agree	2 Disagree	1 Strongly Disagree
1. I am motivated by my peers' posts on social media to take action or pursue my goals.				
2. I think the information shared on social media platforms can provide valuable insights and opportunities for career development.				
3. Career-related information and content that aligns with my interest on social media have an influence my career choices.				
4. Advice and opinions from social media connections influence me in making my career-related decisions.				
5. My choices in choosing this career path are influenced by insights and advice from professionals who share their experiences in social media.				
6. My choices are influenced by the exposure to cultures and the diversity social media and streaming services introduce.				
7. Sharing of personal challenges, setbacks, and perseverance stories inspires me to overcome challenges and pursue my desired career.				
8. Expressing achievements and progress on streaming services influences my career choice, as the feedback and approval from my peers boosts my confidence to pursue the career.				
9. I rely on most of my sources of career information from social media.
